

MARKETING PERFORMANCE ANALYSIS

MARKETING INSIGHTS & RECOMMENDATIONS

1. PURPOSE OF THE ANALYSIS

The purpose of this analysis was to evaluate marketing performance across customer demographics, geographic markets, products, campaigns, and key performance indicators using Microsoft Power BI.

The dashboard was developed to transform marketing and customer data into visual insights that can support the evaluation of revenue performance, customer characteristics, product contribution, and campaign effectiveness.

The analysis covers three major areas:

- Overall Marketing Performance
- Customer Demographic Analysis
- Product Performance Analysis

2. KEY INSIGHT 1: OVERALL MARKETING PERFORMANCE

Observation:

The analysis covers 2.24K customers and reports an average revenue of approximately \$3.63K per customer. Total revenue generated in the analysed period is approximately \$8M, while the overall campaign success rate is 7.45%.

The revenue trend dashboard also enables performance comparison across the period from 2012 to 2014.

Business Interpretation:

The overall revenue performance indicates a strong customer revenue base. However, the campaign success rate is considerably lower than the overall customer and revenue scale, indicating an opportunity to improve the effectiveness of marketing campaigns and customer response.

Potential Action:

Marketing teams should focus on identifying the characteristics of customers and campaigns associated with stronger responses. Campaign performance should be monitored alongside revenue and customer value to evaluate not only campaign reach, but also the quality of customer response and business outcomes.

3. KEY INSIGHT 2: CAMPAIGN PERFORMANCE

Observation:

The campaign analysis shows that the Initial Campaign recorded the highest number of successful responses, with 334 responses. Among the numbered campaigns, Campaign 4 recorded 167 responses, followed by Campaign 3 and Campaign 5 with 163 responses each. Campaign 1 recorded 144 responses, while Campaign 2 recorded the lowest number of responses at 30.

Business Interpretation:

The difference in campaign response suggests that campaign performance varies considerably across different campaigns. The stronger performance of the Initial Campaign and Campaign 4 indicates that campaign design, target audience, offer structure, timing, or communication approach may influence customer response.

The significantly lower response associated with Campaign 2 suggests that its approach may have been less effective for the targeted audience.

Potential Action:

Future marketing campaigns should analyse the characteristics of higher-performing campaigns and identify the factors that may have contributed to their stronger response. Campaigns with weaker performance should be reviewed to understand potential improvements in targeting, communication, offer design, and customer segmentation.

4. KEY INSIGHT 3: MARKETING CHANNEL AND CUSTOMER ENGAGEMENT PERFORMANCE

Observation:

The dataset includes multiple customer purchase channels, including web, catalogue, and store purchases, as well as web visit activity. This provides an opportunity to evaluate customer engagement and purchasing behaviour across different channels.

Business Interpretation:

Customer purchasing behaviour across different channels can provide valuable insights into how customers interact with the business. Differences in channel activity may indicate varying customer preferences and levels of digital engagement.

Potential Action:

Marketing teams should evaluate customer activity across available channels and use the findings to develop more targeted communication strategies. Customers with strong digital engagement may be suitable for digital campaigns, while customers with stronger catalogue or store purchasing behaviour may require different communication approaches.

5. KEY INSIGHT 4: CUSTOMER DEMOGRAPHIC AND GEOGRAPHIC RESPONSE

Observation:

The customer demographic analysis shows that Married customers represent the largest customer group at 38.57%, followed by Together at 25.89% and Single customers at 21.74%. The dashboard also shows revenue variation across countries, with Spain representing the largest revenue contribution among the displayed geographic markets.

The analysis further shows differences in average income across educational groups, with postgraduate customers having the highest average income among the groups displayed.

Business Interpretation:

The results indicate that customer demographics and geographic origin can provide useful segmentation dimensions for marketing analysis. Customer groups may differ in purchasing capacity, product preferences, and response to marketing campaigns.

The higher revenue contribution from certain geographic markets also indicates that regional customer concentration may be important for marketing planning.

Potential Action:

Marketing campaigns can be segmented according to customer demographics, geographic markets, and purchasing behaviour. Higher-value customer groups and stronger-performing markets can be studied further to understand their preferences and develop more relevant marketing communication.

6. KEY INSIGHT 5: PRODUCT PERFORMANCE

Observation:

Product-level analysis shows that MntWines generated the highest revenue contribution at approximately \$0.68M, followed by MntMeatProducts at approximately \$0.37M. MntGoldProds contributed approximately \$0.10M, while MntFishProducts, MntSweetProducts, and MntFruits contributed lower revenue amounts in comparison.

The analysis also identifies the top-selling product category and displays an average transaction value of approximately \$100.97.

Business Interpretation:

The results indicate that product categories contribute differently to overall revenue. The stronger performance of wine and meat products suggests that these categories are important contributors to customer spending within the analysed dataset.

Lower-performing categories may represent opportunities for cross-selling, bundling, targeted promotions, or further customer preference analysis.

Potential Action:

Marketing strategies should prioritise high-performing product categories while also exploring opportunities to increase the contribution of lower-performing categories through targeted offers, cross-selling, and personalised promotions.

7. KEY PERFORMANCE INDICATORS

The dashboard monitors the following key performance indicators:

- Total Customers: 2.24K
- Total Revenue: Approximately \$8M
- Average Revenue per Customer: Approximately \$3.63K
- Campaign Success Rate: 7.45%
- Average Transaction Value: Approximately \$100.97
- Product Revenue Performance
- Campaign Response Performance
- Revenue by Geographic Origin

These KPIs provide a structured overview of customer value, revenue generation, campaign effectiveness, product contribution, and geographic performance.

8. HIGH-VALUE CUSTOMER INSIGHTS

The dashboard includes a high-value customer leaderboard that highlights customers generating the highest revenue contribution.

The highest-ranked customers generated approximately \$15K in revenue each, demonstrating the importance of identifying and monitoring high-value customers.

Business Interpretation:

A relatively small group of high-value customers may contribute significantly to overall revenue. Understanding the characteristics and purchasing behaviour of these customers can help businesses improve customer retention and develop targeted marketing strategies.

Potential Action:

High-value customers can be considered for targeted retention initiatives, personalised communication, loyalty programmes, and relevant cross-selling opportunities.

9. RECOMMENDATIONS

Based on the analysis, the following recommendations can be considered:

- Study the characteristics of high-performing campaigns to improve future campaign design.
- Review the reasons behind the comparatively lower response of Campaign 2.
- Develop customer segmentation strategies using demographic, geographic, and purchasing data.
- Prioritise high-revenue product categories while exploring cross-selling opportunities for lower-performing categories.
- Develop targeted strategies for high-value customers to support customer retention.
- Evaluate customer engagement across web, catalogue, and store purchasing channels.
- Focus marketing efforts on stronger-performing geographic markets while identifying growth opportunities in lower-performing regions.
- Monitor campaign success rate alongside revenue and customer value to evaluate overall marketing effectiveness.
- Continue using a centralised Power BI dashboard for regular monitoring of marketing KPIs.

10. CONCLUSION

The analysis demonstrates how Microsoft Power BI can be used to transform customer and marketing data into visual business insights.

The dashboard provides a structured view of overall marketing performance, customer demographics, geographic revenue, product contribution, campaign performance, and high-value customers.

The analysis indicates that marketing performance can be improved through stronger campaign evaluation, customer segmentation, product-focused marketing, geographic analysis, and targeted engagement of high-value customers.

Overall, the project demonstrates the ability to use Power BI not only to create dashboards, but also to interpret marketing data and translate analytical findings into potential business recommendations.
