

MARKETING PERFORMANCE ANALYSIS

BUSINESS PROBLEM & ANALYTICAL OBJECTIVES

1. BUSINESS CONTEXT

Marketing teams generate data across multiple campaigns, channels, customer groups, and performance indicators.

Without structured analysis, it can be difficult to understand which campaigns and channels are performing effectively, how customers are responding, and where opportunities for improvement exist.

This project focuses on using Power BI to organise, analyse, and visualise marketing performance data.

2. BUSINESS PROBLEM

The key business challenge addressed in this project was:

How can marketing performance data be analysed and visualised to understand campaign effectiveness, customer engagement, channel performance, and overall marketing outcomes?

3. ANALYTICAL OBJECTIVES

The project aimed to:

- Analyse overall marketing performance.
- Evaluate campaign-level performance.
- Compare marketing channels and their effectiveness.
- Understand customer engagement and response patterns.
- Monitor key marketing performance indicators.
- Identify areas of strong and weak performance.
- Present insights through an interactive Power BI dashboard.

4. KEY BUSINESS QUESTIONS

The analysis was designed to explore questions such as:

- Which campaigns are performing most effectively?
- Which marketing channels generate stronger engagement?
- How do customer segments respond to marketing activities?
- Which performance indicators require attention?
- What patterns can be observed across marketing activities?
- How can marketing performance be monitored through a centralised dashboard?

5. ANALYTICAL APPROACH

Step 1: Data Understanding

The available dataset and field descriptions were reviewed to understand the structure and meaning of the data.

Step 2: Data Preparation

The data was prepared for analysis and structured within the Power BI environment.

Step 3: Data Modelling

Relevant fields and relationships were organised to support analysis and dashboard development.

Step 4: KPI Analysis

Marketing performance indicators were analysed to understand campaign and channel outcomes.

Step 5: Dashboard Development

A three-page Power BI dashboard was developed to present the analysis through interactive visualisations.

Step 6: Business Interpretation

The visualised data was reviewed to identify marketing performance patterns and potential areas for improvement.

6. PRIMARY TOOL

Microsoft Power BI

7. PROJECT OUTPUT

The final output is a three-page interactive Power BI marketing performance dashboard supported by structured source data and field-level documentation.
